## Asymptotic Notation $\Theta$ , $O$ , $o$ , $\omega$ , $\Omega$ ; zoo

$\Theta$

$\Theta(g(n)) = \{f(n) : \text{there exists positive constants } c_1, c_2 \text{ and } n_0 \text{ such that } 0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n) \text{ for all } n \geq n_0\}$

- $\Theta(x) = \{3x, 5x + 4, \dots\}$
- $\Theta(\log x) = \{4 \log x, 5 \log(x^3), 5 \log(x^3) + 2, \dots\}$
- We write  $5x + 4 = \Theta(x)$  to mean  $5x + 4 \in \Theta(x)$

## Asymptotic Notation $O$

$\Theta$

$\Theta(g(n)) = \{f(n) : \text{there exists positive constants } c_1, c_2 \text{ and } n_0 \text{ such that } 0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n) \text{ for all } n \geq n_0\}$

$O$

$O(g(n)) = \{f(n) : \text{there exists positive constants } c \text{ and } n_0 \text{ such that } 0 \leq f(n) \leq cg(n) \text{ for all } n \geq n_0\}$

- $O(x) = \{3x, 5x + 4, 3\sqrt{x} + 4, 3\sqrt{x} + 4 \log x, 7, \dots\}$

## Asymptotic Notation $o$

$O$

$O(g(n)) = \{f(n) : \text{there exists positive constants } c \text{ and } n_0 \text{ such that } 0 \leq f(n) \leq cg(n) \text{ for all } n \geq n_0\}$

$o$

$o(g(n)) = \{f(n) : \text{for any positive constants } c, \text{ there exists a constant } n_0 > 0 \text{ such that } 0 \leq f(n) < cg(n) \text{ for all } n \geq n_0\}$

- $O(x) = \{3x, 5x + 4, 3\sqrt{x} + 4, 3\sqrt{x} + 4 \log x, 7, \dots\}$
- $o(x) = \{3\sqrt{x} + 4, 3\sqrt{x} + 4 \log x, 7, \dots\}$

$$\lim_{n \rightarrow \infty} f(n)/g(n) = 0$$

## Asymptotic Notation $\Omega$

$\Theta$

$\Theta(g(n)) = \{f(n) : \text{there exists positive constants } c_1, c_2 \text{ and } n_0 \text{ such that } 0 \leq c_1 g(n) \leq f(n) \leq c_2 g(n) \text{ for all } n \geq n_0\}$

$\Omega$

$\Omega(g(n)) = \{f(n) : \text{there exists positive constants } c \text{ and } n_0 \text{ such that } 0 \leq cg(n) \leq f(n) \text{ for all } n \geq n_0\}$

- $\Omega(x) = \{3x, 5x + 4, 3x\sqrt{x} + 4, 3x\sqrt{x} + 4 \log x, 5x^6 + 3x^4 + 5, \dots\}$

## Asymptotic Notation $\omega$

$\Omega$

$\Omega(g(n)) = \{f(n) : \text{there exists positive constants } c \text{ and } n_0 \text{ such that } 0 \leq cg(n) \leq f(n) \text{ for all } n \geq n_0\}$

$\omega$

$\omega(g(n)) = \{f(n) : \text{for any positive constants } c, \text{ there exists a constant } n_0 > 0 \text{ such that } 0 \leq cg(n) < f(n) \text{ for all } n \geq n_0\}$

- $\Omega(x) = \{3x, 5x + 4, 3x\sqrt{x} + 4, 3x\sqrt{x} + 4 \log x, 5x^6 + 3x^4 + 5, \dots\}$
- $\omega(x) = \{3x\sqrt{x} + 4, 3x\sqrt{x} + 4 \log x, 5x^6 + 3x^4 + 5, \dots\}$

$$\lim_{n \rightarrow \infty} f(n)/g(n) = \infty$$

## Recurrence Relation

### Equations of the form

$$T(n) = \begin{cases} \Theta(1) & \text{if } n \leq c \\ aT(n/b) + f(n) & \text{otherwise} \end{cases}$$

#### How to solve?

- 1 Substitution: guess the solution and test
- 2 Iteration: convert into summation and apply bounds
- 3 Master method

## Substitution

### Consider equation

$$T(n) = 2T(\lfloor n/2 \rfloor) + n$$

Let we guess the solution to be  $T(n) = O(n \log n)$

$$T(n) \leq 2(c \lfloor n/2 \rfloor \log(\lfloor n/2 \rfloor)) + n \quad (1)$$

$$\leq cn \log(n/2) + n \quad (2)$$

$$= cn \log(n) - cn \log 2 + n \quad (3)$$

$$= cn \log(n) - cn + n \quad (4)$$

$$\leq cn \log(n) \quad (5)$$

As long as  $c > 1$

## Iteration

### Consider equation

$$T(n) = 3T(\lfloor n/4 \rfloor) + n$$

$$T(n) = n + 3T(\lfloor n/4 \rfloor) \quad (6)$$

$$= n + 3(\lfloor n/4 \rfloor + 3T(\lfloor n/16 \rfloor)) \quad (7)$$

$$= n + 3(\lfloor n/4 \rfloor + 3(\lfloor n/16 \rfloor + 3T(\lfloor n/64 \rfloor))) \quad (8)$$

$$= n \sum_{i=0}^{\infty} (3/4)^i + \Theta(3^{\log_4 n}) \quad (9)$$

$$= 4n + o(n) \quad (10)$$

$$= O(n) \quad (11)$$

$$(12)$$

Iteration stops when  $\lfloor n/4^i \rfloor = 1$  that is  $i = \log_4 n$

## Master method

When  $T(n) = aT(n/b) + f(n)$   $a \geq 1, b > 1$   $n$  is positive

Let  $\epsilon > 0$  be a constant

- 1 If  $f(n) = O(n^{\log_b a - \epsilon})$  then  $T(n) = \Theta(n^{\log_b a})$
- 2 If  $f(n) = \Theta(n^{\log_b a})$  then  $T(n) = \Theta(n^{\log_b a} \log n)$
- 3 If  $f(n) = \Omega(n^{\log_b a + \epsilon})$  then  $T(n) = \Theta(f(n))$  provided if  $af(n/b) \leq cf(n)$  for some constant  $c < 1$  and all sufficiently large  $n$ . **Regularity condition must be checked in case-3.**

## Integer Multiplication

- How do you multiply integers? How much time it takes?
- If  $x = x_1 \times 10^{n/2} + x_0$
- Then  $xy = x_1 y_1 \cdot 10^n + (x_1 y_0 + x_0 y_1) \cdot 10^{n/2} + x_0 y_0$

$$T(n) \leq 4T(n/2) + c.n$$

## Integer Multiplication

### Recursive Multiply parts

#### Algorithm 1: Rec-Mul (x,y)

- 1  $p = \text{Rec-Mul}(x_1 + x_0, y_1 + y_0)$
- 2  $x_1 y_1 = \text{Rec-Mul}(x_1, y_1)$
- 3  $x_0 y_0 = \text{Rec-Mul}(x_0, y_0)$
- 4 **return**  $x_1 y_1 \times 10^n + (p - x_1 y_1 - x_0 y_0) \times 10^{n/2} + x_0 y_0$

### Time complexity

$$T(n) \leq 3T(n/2) + c.n$$

$$O(n^{\log_2 3}) = O(n^{1.59})$$

# Thank You!

**Thank you very much for your attention! (Reference<sup>1</sup>)**
