

# Internet of Things

Rpi – Usage & GPIO Demo

# Getting Started

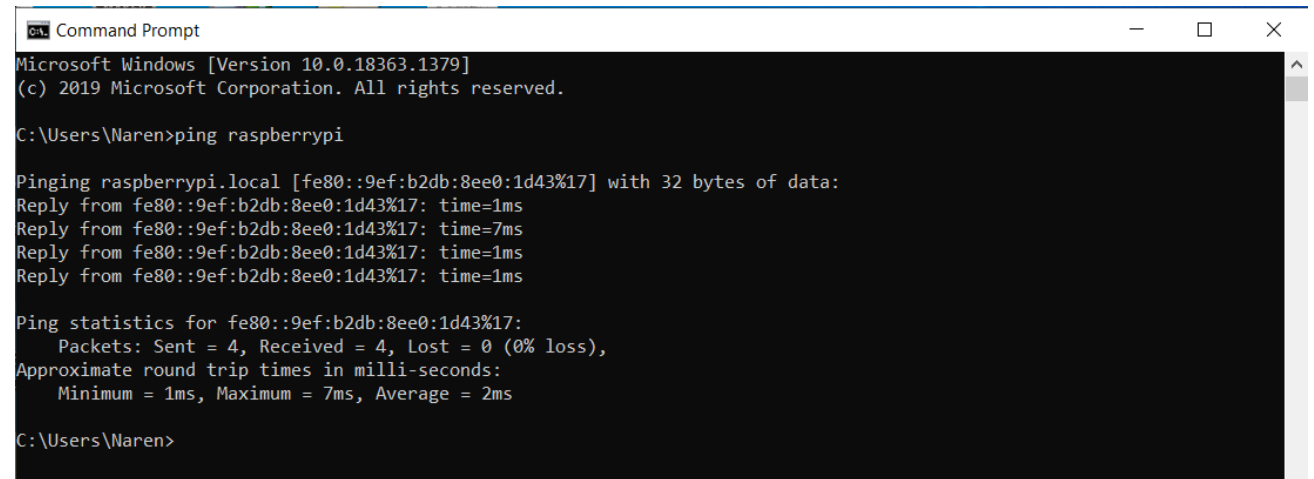

- Hardware Requirements:
  - 1 x Raspberry Pi Board(Any variant ).
  - 1 x USB Cable (Power Adapter/ Laptop USB Port)
  - 1 x 16 or 32 Gb SD card.
- 1 Keyboard.
- 1 Mouse.
- 1 Monitor screen.

# Detect RPi on the network

Open **Command Prompt** terminal and type “**ping raspberrypi**”.

**A valid response** it indicates that the raspberry pi and the Laptop are present in the same network.

```

# Finding IP Address – Angry IP Scanner

- After receiving conformation about the availability of the device, the IP address of the device must be determined to establish the virtual connection.
- For this purpose we can use “**Angry IP Scanner**” software , which scans the entire subnet to determine various devices which are connected to the network.
- The highlighted portion in yellow is the IP address of the Raspberry-Pi device.

# Connecting through VNC

- Open the **VNC Viewer** on your computer, enter the IP address of the RPi and press Enter on your keyboard.
- Once it connects, enter the correct login credentials to start using the RPi

Username: ***pi***

Password: ***raspberrypi***

# Accessing R-Pi

- After Successful login, the R-Pi device comes online.

# Demo-I

Configuring GPIO and Blinking LED

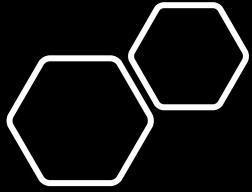

# Connections

- LED Pos -> Pin 11 (GPIO17)
- Led Neg -> Ground (Pin 6)

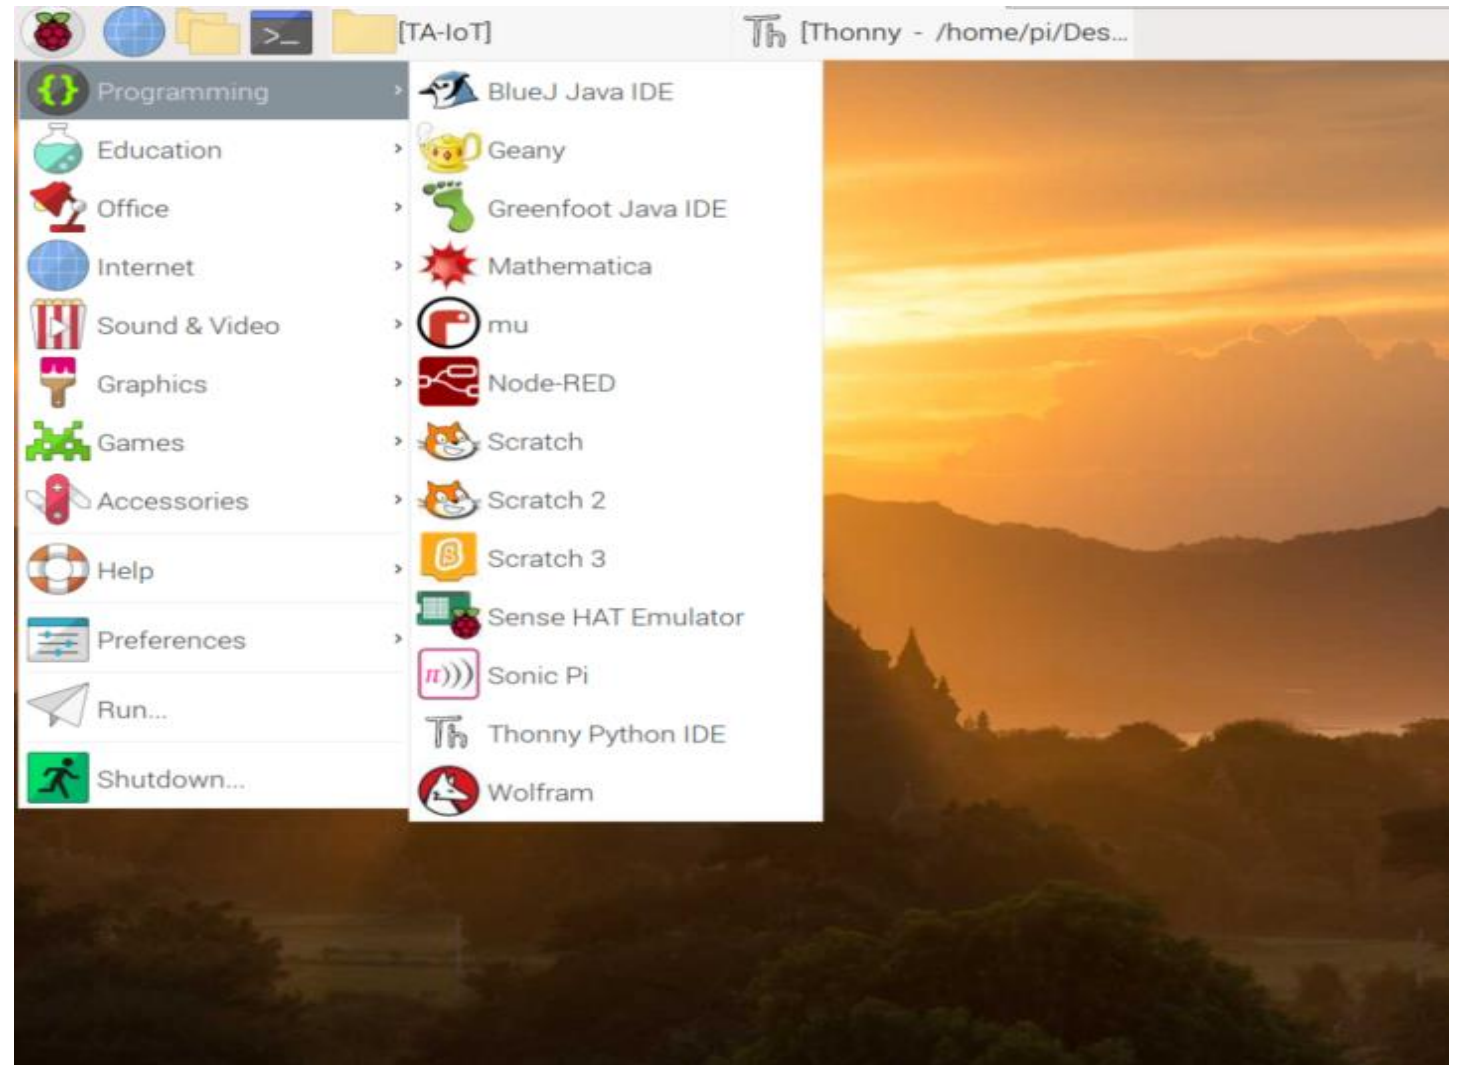

3V3 power	1	2	5V power
GPIO 2 (SDA)	3	4	5V power
GPIO 3 (SCL)	5	6	Ground
GPIO 4 (GPCLK0)	7	8	GPIO 14 (TXD)
Ground	9	10	GPIO 15 (RXD)
GPIO 17	11	12	GPIO 18 (PCM_CLK)
GPIO 27	13	14	Ground
GPIO 22	15	16	GPIO 23
3V3 power	17	18	GPIO 24
GPIO 10 (MOSI)	19	20	Ground
GPIO 9 (MISO)	21	22	GPIO 25

# DEMO -1 : Blinking LED with GPIO

Open Thonny Python IDE from start  
menu.

## Code: Blinking LED with GPIO

LED\_simple\_new.py ✕

```
1 import RPi.GPIO as GPIO
2 import time
3 LedPin = 11 # Corresponds to GPIO 17
4 GPIO.setmode(GPIO.BOARD) #Numbers GPIO by Physical Location
5 GPIO.setup(LedPin ,GPIO.OUT) #Set LedPin's to Output mode
6 GPIO.output(LedPin, GPIO.HIGH) #Set LedPin HIGH (3.3V) to turn on LED
7 try:
8     while True:
9         GPIO.output(LedPin, GPIO.HIGH)
10        time.sleep(0.5)
11        GPIO.output(LedPin, GPIO.LOW)
12        time.sleep(0.5)
13 except KeyboardInterrupt:
14     GPIO.output(LedPin, GPIO.LOW)
15     GPIO.cleanup() #Release Resource
```

## Code: Varying LED Brightness with PWM

GPIO\_PWM.py ✕

```
1 import RPi.GPIO as GPIO
2 import time
3 GPIO.setmode(GPIO.BOARD)
4 GPIO.setup(12,GPIO.OUT)
5 pwm12 = GPIO.PWM(12,50)
6 pwm12.start(0)
7 try:
8     while True:
9         for dutyCycle in range (0,100,5):
10             pwm12.ChangeDutyCycle(dutyCycle)
11             time.sleep(0.05)
12         for dutyCycle in range(100,0,-5):
13             pwm12.ChangeDutyCycle(dutyCycle)
14             time.sleep(0.05)
15 except KeyboardInterrupt:
16     pwm12.stop()
17 GPIO.cleanup()
```

# Internet of Things

Servo Motor

# Servo Motor

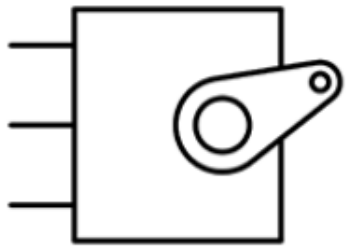

- A servo motor is a type of a DC motor that, upon receiving a signal of certain frequency , can rotate itself to any angle from 0- 180 degrees.
- Its 90 degree position is generally referred to as neutral position because it can rotate equally from that position.

# Servo Motor Interfacing

- The servo motor has 3 pins :
  1. Power Pin (5V)
  2. Data Pin(3.3V)
  3. Ground Pin
- The power Pin is connected to the 5V power supply.
- The Data pin is interfaced with the GPIO pin of the R-Pi.
- The Gnd pin of the servo motor is connected with the Gnd pin of the R-Pi.
- The Data pin of the Servo motor is provided with PWM modulated voltage to control the rotation of the R-Pi.

PWM=Orange ( )  
Vcc = Red ( + )  
Ground=Brown ( - )

28         time.sleep(3)
29 except KeyboardInterrupt:
30     pwm_servo.stop()
31 GPIO.cleanup()
```

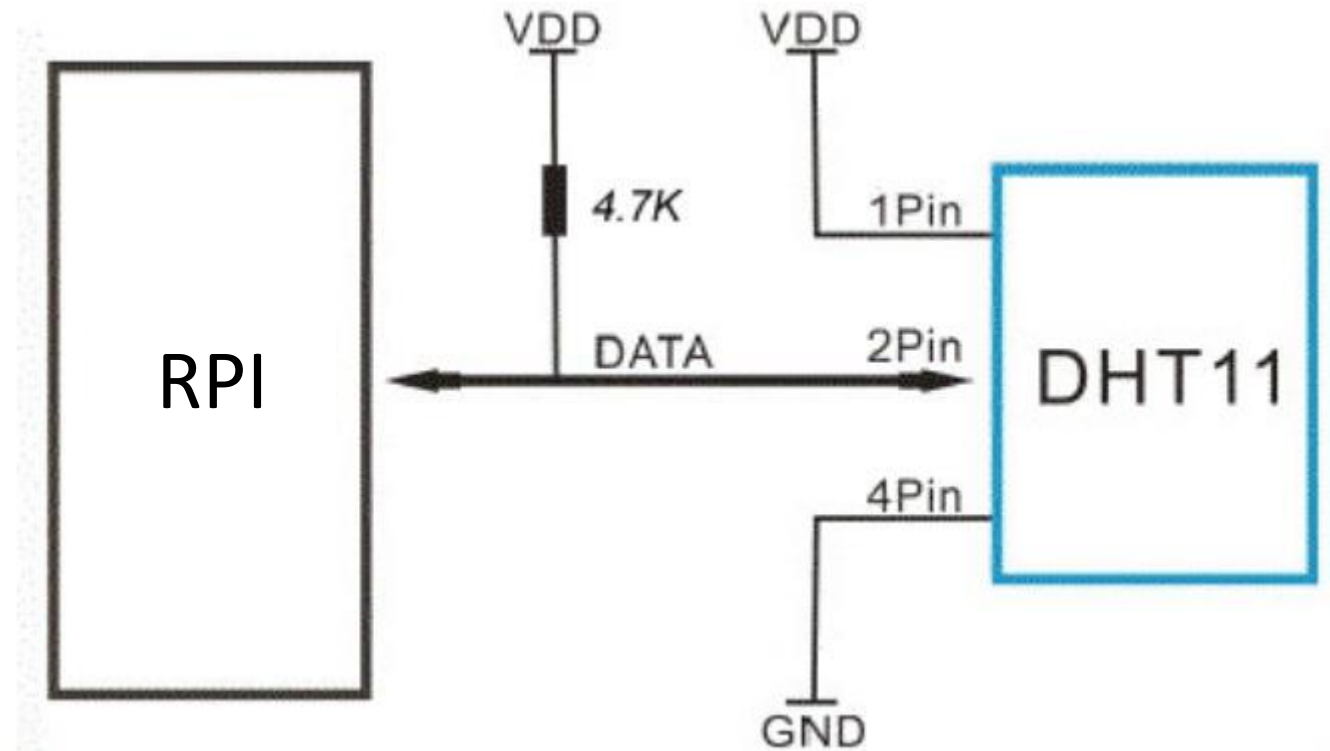

# Internet of Things

Interfacing DHT 11 (Temp & Humidity Sensor)

# Temperature and Humidity Sensor

- The DHT 11 is a temperature and a Humidity sensor that provides **digital temperature and humidity readings**.
- Popular for use in **remote weather stations, soil monitors and home automation systems**.

# Connections

# 1. Request Data

- 1) **Request:** To make the DHT-11 to send you the sensor readings you have to send it a request. The request is, to pull down the bus for more than **18ms** in order to give DHT time to understand it and then pull it up for **40uS**.

# Response from DHT11

- 2) **Response:** What comes after the request is the DHT-11 response. This is an automatic reply from DHT which indicates that DHT received your request. The response is  $\sim 54\mu\text{s}$  low and  $80\mu\text{s}$  high.

### 3. Data Reading

- 3) **Data Reading:** What will come after the response is the sensor data. The data will be packed in a packet of 5 segments of 8-bits each. Totally  $5 \times 8 = 40$  bits.

First two segments are Humidity read, integral & decimal. Following two are Temperature read in Celsius, integral & decimal and the last segment is the Check Sum which is the sum of the 4 first segments. If Check Sum's value isn't the same as the sum of the first 4 segments that means that data received isn't correct.

# Identifying Data Bits

**How to Identify Bits:** Each bit sent is a follow of  $\sim 54\mu\text{s}$  Low in the bus and  $\sim 24\mu\text{s}$  to  $70\mu\text{s}$  High depending on the value of the bit.

Bit '0' :  $\sim 54\mu\text{s}$  Low and  $\sim 24\mu\text{s}$  High

Bit '1' :  $\sim 54\mu\text{s}$  Low and  $\sim 70\mu\text{s}$  High

**End Of Frame:** At the end of packet DHT sends a  $\sim 54\mu\text{s}$  Low level, pulls the bus to High and goes to sleep mode.

# Installing a DHT Library

## Software Setup

To start with update your package lists and install a few Python libraries :

```
sudo apt-get update  
sudo apt-get install build-essential python-dev
```

Then clone the Adafruit library from their repository :

```
git clone https://github.com/adafruit/Adafruit_Python_DHT.git  
cd Adafruit_Python_DHT
```

Then install the library for Python 2 and Python 3 :

```
sudo python setup.py install  
sudo python3 setup.py install
```

Hopefully at this point the library is installed and ready to be used within a Python script.

# Code: Interfacing DHT11 Sensor

DHT\_11.py ✕

```
1 import Adafruit_DHT
2 DHT11_sensor = Adafruit_DHT.DHT11 #DHT11 Instance
3
4 # Data Pin Connected to GPIO 17 (Pin 11 on Raspberry Pi)
5 gpio=17
6
7 # Use read_retry method. This will retry up to 15 times to
8 # get a sensor reading (waiting 2 seconds between each retry).
9 humidity, temperature = Adafruit_DHT.read_retry(DHT11_sensor, gpio)
10 # Reading the DHT11 is very sensitive to timings and occasionally
11 # the Pi might fail to get a valid reading. So check if readings are valid.
12 if humidity is not None and temperature is not None:
13     print('Temp={0:0.1f}*C Humidity={1:0.1f}%'.format(temperature, humidity))
14 else:
15     print('Failed to get reading. Try again!')
