Introduction

$$\sum_{i=1}^n p_i + \sum_{i=0}^n q_i = 1$$

Expected Search Cost in tree T

$$E[T] = \sum_{i=1}^n (\text{depth}_T(k_i) + 1) \times p_i + \sum_{i=0}^n (\text{depth}_T(d_i) + 1) \times q_i$$

Optimal Substructure

- Any non-leaf sub-tree of BST must contain keys in continuous range k_i, \dots, k_j for some $1 \leq i \leq j \leq n$
- Subtree T' of an optimal BST T must be optimal

Contradiction: If T'' is optimal then put T'' in T at the place of T'

- Brute-force would take $\Omega(4^n/n^{3/2})$ time

Searching

Consider a subsequence $K = \langle k_1, k_2, \dots, k_n \rangle$ of n distinct keys (in sorted order). Let p_i be the probability of searching k_i

- We wish to construct a **binary search tree** (BST) with **minimum expected search cost**

Example: Expected Search Cost

Let $\langle p_1, p_2, p_3, p_4, p_5 \rangle = \langle 0.15, 0.10, 0.05, 0.10, 0.20 \rangle$ and
 $\langle q_0, q_1, q_2, q_3, q_4, q_5 \rangle = \langle 0.05, 0.10, 0.05, 0.05, 0.05, 0.10 \rangle$

Problem formulation

Let k_r be at root

- $T_{<}$ has keys k_0, k_1, \dots, k_{r-1}
- $T_{>}$ has keys $k_{r+1}, k_{r+2}, \dots, k_n$
- Let $E[T_{<}]$ is expected search cost of $T_{<}$ and
 $w[T_{<}] = \sum_{i=1}^{r-1} p_i + \sum_{i=0}^{r-1} q_i$,
 $w[T_{>}] = \sum_{i=r+1}^n p_i + \sum_{i=r}^n q_i$

Expected search cost of the tree is

$$E[T] = E[T_{<}] + w[T_{<}] + E[T_{>}] + w[T_{>}] + p_r$$

$$= E[T_{<}] + E[T_{>}] + 1$$

Overlapping subproblems?

Using Dynamic Programming

- $e[i, j]$ expected search cost for optimal BST for keys k_i, \dots, k_j
- $w[i, j] = \sum_{v=i}^j p_v + \sum_{v=i-1}^j q_v$

If k_r is root then

$$\begin{aligned} e[i, j] &= p_r + e[i, r-1] + w[i, r-1] + e[r+1, j] + w[r+1, j] \\ &= e[i, r-1] + e[r+1, j] + w[i, j] \end{aligned}$$

We have to choose r that maximizes $e[i, j]$

$$e[i, j] = \begin{cases} q_{i-1} & \text{if } j = i - 1 \\ \min_{i \leq r \leq j} \{e[i, r-1] + e[r+1, j] + w[i, j]\} & \text{otherwise} \end{cases}$$

The algorithm

Algorithm 1: Optimal-BST(p, q, n)

```

1 for  $i = 1$  to  $n + 1$  do
2    $e[i, i - 1] = w[i, i - 1] = q_{i-1}$ 
3 for  $l = 1$  to  $n$  do
4   for  $i = 1$  to  $n - l + 1$  do
5      $j = i + l - 1$ 
6      $e[i, j] = \infty$ 
7      $w[i, j] = w[i, j - 1] + p_j + q_j$ 
8     for  $r = i$  to  $j$  do
9       if  $e[i, r - 1] + e[r + 1, j] + w[i, j] < e[i, j]$  then
10         $e[i, j] = e[i, r - 1] + e[r + 1, j] + w[i, j]$ 
11         $root[i, j] = r$ 
12 return  $e$  and  $root$ 

```

Complexity: time $O(n^3)$, space $O(n^2)$

Example: Expected Search Cost

Let $\langle p_1, p_2, p_3, p_4, p_5 \rangle = \langle 0.15, 0.10, 0.05, 0.10, 0.20 \rangle$ and
 $\langle q_0, q_1, q_2, q_3, q_4, q_5 \rangle = \langle 0.05, 0.10, 0.05, 0.05, 0.05, 0.10 \rangle$
