

# COMPLEXITY – OPTIMIZATION PROBLEMS

## Intractable Problems

- Optimization Problems - Examples
- Complexity Classes **PO** and **NPO**

# OPTIMIZATION PROBLEMS - CHARACTERIZATION

## ○ Formal Description:

- An optimization problem  $\pi$  is characterized by the quadruple  $(I_\pi, F_\pi, m_\pi, \text{goal}_\pi)$ 
  - $I_\pi = \{x \mid x \text{ is an input instance of } \pi\}$
  - $F_\pi(x) = \{s \mid s \text{ is a feasible solution for } x, \text{ where } x \in I_\pi\}$
  - $m_\pi(x, y) = v$  where  $v$  is a quantitative measure of the “value” of the feasible solution  $y \in F_\pi(x)$  for  $x \in I_\pi$
  - $\text{goal}_\pi \in \{\min, \max\}$

# OPTIMIZATION PROBLEMS - EXAMPLES

## ○ Min Vertex Cover

- $I = \{G \mid G \text{ is an undirected graph}\}$
- $F(G) = \{ S \mid S \subseteq V \text{ s.t. for any } (u,w) \text{ in } E: \\ u \text{ in } S \text{ or } v \text{ in } S, \text{ where } G = (U,V)\}$
- $m(G, S) = |S|$  where  $G$  in  $I$  and  $S$  in  $F(G)$
- goal: min

## ○ TSP

- $I = \{G \mid G \text{ is a weighted, completely-connected graph}\}$
- $F(G) = \{ (u_1, u_2, u_3, \dots, u_n, u_1) \mid G=(V,E,w), n = |V|, \\ u_i \text{ in } V \text{ for any } i \text{ in } 1..n, \\ u_i \neq u_j \text{ for any } i \text{ and } j \text{ in } 1..n \}$
- $m(G, P) = \sum_{e \text{ in } P} w(e)$  where  $G = (V,E,w)$ ,  $P$  in  $F(G)$
- goal: min

# OPTIMIZATION PROBLEMS

## ○ Optimal Solution:

- The optimal solution for a given instance  $x$  of a problem  $\pi$  is characterized by:

- The optimal measure:

- $m_{\pi}^*(x) = \text{goal}_{\pi}\{m_{\pi}(x, y) \mid y \in F_{\pi}(x)\}$

- The optimal solution is characterized thus:

- $\text{OPT}_{\pi}(x) = y$  where  $y \in F_{\pi}(x)$  and  $m_{\pi}^*(x) = m_{\pi}(x, y)$

## ○ Note:

- The objective – for a given context – may be to find
  - The optimal solution (*Constructive Version*) OR
  - The optimal measure i.e. the measure of the optimal solution (*Evaluative Version*)

# CLASSES $\mathsf{PO}$ AND $\mathsf{NPO}$

## ○ $\mathsf{PO}$

- An optimization problem  $\pi$  is in  $\mathsf{PO}$  if there exists an algorithm that solves  $\pi$  in polynomial time

## ○ $\mathsf{NPO}$ :

- An optimization problem  $\pi = (I, F, m, \text{goal})$  belongs to the class  $\mathsf{NPO}$  if
  - membership  $I$  is decidable in polynomial time
  - there exists a polynomial  $q$  such that
    - given  $x$  in  $I$  and for any  $y$  in  $F(x)$ :
    - $|y| \leq q(|x|)$  and
    - $y$  in  $F(x)$  is decidable in polynomial time.
  - $m$  is computable in poly time.
- Example:
  - Vertex Cover is in  $\mathsf{NPO}$
